

# SmartSocket

Plug into the future

If you can put a plug into a socket, you can automate your home.

With the HDL SmartSocket gain instant control over your appliances and lamps by simply plugging them in.

## What You Want, When You Want It

A home should meet the needs of its owners effortlessly, that's why HDL has created the SmartSocket.

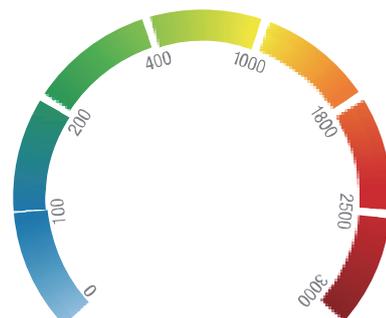

Capable of instantly controlling any plug-in appliance or lamp, you can bring the power of a full automation installation into every corner of your home.

From your Lava lamp to fridge freezer, and television to toaster, full remote control over your electrical devices is now possible.

## Power Monitoring

With a LED halo a simple glance at the SmartSocket lets you know the current energy consumption of your connected appliance.

From cornflower blue indicating a light load, all the way to ocher red indicating a heavy load, you can easily monitor exactly how much energy is being used.

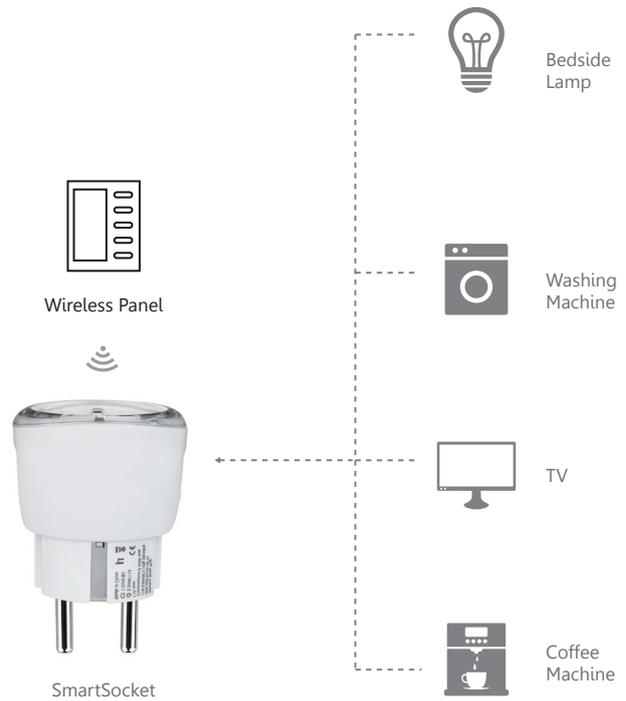

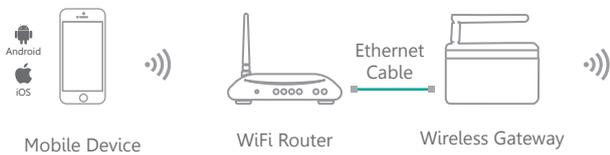

## Remote Control

With the press of a single button you can control one, or all of your SmartSockets, from a single HDL Buspro wireless panel.

If you are looking for truly remote control, simply connect your SmartSockets to the Buspro wireless gateway.

This allows you to control all of your connected lights and appliances from anywhere in the world, via your iOS or Android device.

## Fully Integrated

Automating your appliances with a SmartSocket means that you can create a truly inclusive automation solution.

Through sensors that turn on your lamps when you enter a room, to turning on a coffee machine in the morning, the possibilities of an integrated Buspro automation installation are practically endless.

## Scenes

Include the appliances and devices connected to the SmartSocket into your homes scenes, so that you can create the perfect environment with a single button press.

From turning the lamps in the living room off during your movie night, to turning on the washing machine and dishwasher for when you need to complete your chores, the SmartSocket gives you complete and instant appliance control.

Of all the scenes, the most common is also the simplest, the 'all off' or 'all on'. Used as a master appliance manager, it ensures that your connected appliances are always under your control.

## Safe

With a combination of overheat and overcurrent protection, your connected appliance is safer and more protected than when plugged into a standard socket.

If your SmartSocket does experience a greater current, or temperature then is deemed safe, the halo will flash red for 10 seconds and then automatically shut off the power to the appliance.
